Hogyan lehet deklarálni a modult a TypeScript-ben?

Declaring any of the external modules having no exposed types or values:

```
declare module 'Foo' {
    var x: any;
    export = x;
}
```

For declaring individual classes

```
declare module 'Foo' {
    export type cls = any;
    export var cls: any;
}
```

Hogyan importálhatunk modult?

A modulokat az import kulcsszóval lehet importálni.

Importing individual exports from within a module:

```
import { Employee } from "./Employee";
let empObj = new Employee("Best Interview Question", 1);
empObj.displayEmployee(); //Output: Employee Code: 1, Employee Name: Best Interview Question
```

Now, to import the exports within a module as a variable into another module, use this code:

```
import * as Emp from "./Employee"
console.log(Emp.age); // 10
let empObj = new Emp.Employee("Best Interview Question" , 2);
empObj.displayEmployee(); //Output: Employee Code: 2, Employee Name: Best Interview Question
```
